

Circuit Description

The lens collects the video signal. Then the signal is amplified and controlled by CMOS. Then it is processed by the CMOS. At last, the 2.4G RF TX Module will transmit the video signal.

The MIC collects the audio signal. Then the audio signal is amplified and will be transmitted by the 2.4G RF TX Module.

The +5V DC can supply the whole circuit. The current passes the +5v power jacket. It can supply the IR, too. The IR can be controlled by the CDS.
